

Define Problem Statements

Book a Doctor Platform

Identifying key user pain points in current medical consulting bookings and formulating precise statements that guide our development phase.

1. Target Demographics and Core Users

- **Patients:** Individuals seeking hassle-free doctor consultations without long hospital queue wait times.
- **Doctors:** Medical professionals needing simplified calendar management and digital prescription logging.
- **Administrators:** System operators verifying certifications and tracking overall metrics.

2. Core Problem Statements

- **Problem 1: Inefficient Booking Queues:** Patients waste hours trying to reach clinics via phone or standing in lines, leading to poor customer satisfaction and delayed healthcare.
- **Problem 2: Double-Booking and Calendar Clashes:** Clinics struggle to coordinate schedules. Multiple patients get allocated to overlapping slots, generating friction and clinic stress.
- **Problem 3: Lack of Information Transparency:** Patients cannot verify consultation fees, experience levels, ratings, or doctor status beforehand, risking unverified consultations.
- **Problem 4: Cumbersome Prescription Management:** Paper-based prescriptions are easily lost, leading to pharmacy checkout delays and weak medical history records.

3. Key Goals

Reduce waiting room queues to 0 minutes via exact slot allocations. Deliver 100% verified status display on doctors profiles. Enable automated scheduling with collision prevention filters.
